Submitted by Leiba Rodman

ABSTRACT

Recently, K. I. Gross and the author [J. Approx. Theory 59:224-246 (1989)] analyzed the total positivity of kernels of the form \( K(x, y) = p_{\mathbb{F}_q}(xy), \ x, y \in \mathbb{R}, \) where \( p_{\mathbb{F}_q} \) denotes a classical generalized hypergeometric series. There, we related the determinants which define the total positivity of \( K \) to the hypergeometric functions of matrix argument, defined on the space of \( n \times n \) Hermitian matrices. In the first part of this paper, we apply these methods to derive the total positivity properties of the kernels \( K \) for more general choices of the parameters in these hypergeometric series. In particular, we prove that if \( a_i > 0 \) and \( k_i \) is a positive integer \((i = 1, \ldots, p)\) then \( K(x, y) = p_{\mathbb{F}_q}(a_1, \ldots, a_p; a_1 + k_1, \ldots, a_p + k_p; xy) \) is strictly totally positive on \( \mathbb{R}^2 \). In the second part, we use the theory of entire functions to derive some Pólya frequency function properties of the hypergeometric series \( p_{\mathbb{F}_q}(x) \). Some of these latter results suggest a curious duality with the total positivity properties described above. For instance, we prove that if \( p > 1 \) and the \( a_i \) and \( k_i \) are as above, then there exists a probability density function \( f \) on \( \mathbb{R} \), such that \( f \) is a strict Pólya frequency function, and
\[
\frac{1}{p_{\mathbb{F}_p}}(a_1 + k_1, \ldots, a_p + k_p; a_1, \ldots, a_p, z) = e^z f(z),
\]
the Laplace transform of \( f \).

1. INTRODUCTION

In a recent article, Gross and the author [4] used techniques from harmonic analysis on the space \( S_n \) of \( n \times n \) Hermitian matrices to study the total positivity properties of certain kernels, \( K(x, y) \), defined in terms of the

*This work was supported in part by National Science Foundation grant DMS-8802929, and by the Center for Advanced Studies, University of Virginia.
classical generalized hypergeometric functions. Our methods were based on
an integral representation [4, Theorem 3.1] for the determinants which define
the total positivity of the kernel $K$, and which we describe as follows.

Let $K(x, y) = f(xy)$, where $f$ is a real-analytic function of a real variable.
Let $s$ and $t$ be matrices in $S_n$ having eigenvalues $s_1, \ldots, s_n$ and $t_1, \ldots, t_n$,
respectively, and such that all products $s_it_j$ lie in the domain of $f$. Let
$V(s) = \prod_{1 \leq i < j \leq n} (s_i - s_j)$ denote the Vandermonde determinant. Further
let $U(n)$ denote the group of $n \times n$ unitary matrices and for $u \in U(n)$ let $du$
denote the Haar measure on $U(n)$ normalized to have total volume 1. Then it
is proven in [4, Theorem 3.1] that there exists a sequence of real-analytic
functions $\psi_n$, defined on the space $S_n$, such that for all $n = 1, 2, 3, \ldots$, the
$n \times n$ determinant $\det(K(s_i, t_j))$ may be expressed as

$$\frac{\det(K(s_i, t_j))}{V(s)V(t)} = \int_{U(n)} \psi_n(sutu^{-1}) \, du. \quad (1.1)$$

In particular, the definition of total positivity (see Section 2) implies that the
kernel $K$ is totally positive if and only if the functions $\psi_n$ are all nonnegative
on $S_n$. In the case when $f(x) = _pF_p(x)$ or $_{p+1}F_p(x)$, a classical generalized
hypergeometric series, the functions $\psi_n$ in (1.1) may be expressed in terms of
the hypergeometric functions of matrix argument [3, 5, 6]. In [4] we applied
the theory of the hypergeometric functions of matrix argument, for certain
choices of the hypergeometric parameters, to derive the total positivity of
the kernel $K$.

At this point, two advantages of our techniques are worth noting. Firstly,
the integral representation (1.1) provides an explicit evaluation of the $n \times n$

determinant $\det(K(s_i, t_j))$, and leads to direct proofs of the total positivity of
many kernels; in some cases, the method also determines the sign of the
determinant when the kernel is not totally positive (cf. [4, Corollaries 3.4 and
3.5]). Secondly, our method has the advantage, over more classical methods,
of yielding the maximal domain of positivity for some hypergeometric kernels
(cf. [4, Corollary 3.5 and Theorem 5.5]).

In the first part of this paper, we consider more general choices for the
hypergeometric parameters than were treated in [4]. For instance, if $a_i > 0$
($i = 1, \ldots, p$), it was proved in [2] and [4] that the kernel $K(x, y) = \_pF_p(a_2, \ldots, a_p; a_1 + 1, \ldots, a_p + 1; xy)$, is strictly totally positive (of order
infinity) on $\mathbb{R}^2$. We will extend this result by proving (in Theorem 3.2) that
for positive integers $k_1, \ldots, k_p$, the kernel $K(x, y) = \_pF_p(a_1, \ldots, a_p; a_1 +
1, \ldots, a_p + k_1; xy)$ is strictly totally positive on $\mathbb{R}^2$. Further, we determine
the order of total positivity of $K$ if not all the $k_i > 0$ are positive integers.

The second part of the paper, contained in Section 4, is different in
character from the results described above. In this part, we derive some
Pólya frequency function properties of the hypergeometric series \( pF_q(x) \) when \( p \leq q \). These properties exhibit a surprising duality with the total positivity properties of the \( pF_q \) kernels. By applying I. J. Schoenberg’s characterizations of the Pólya frequency functions on \( \mathbb{R} \) [7, Chapter 7] together with some general results on entire functions [8], we prove that there exist probability density functions \( f \) on \( \mathbb{R} \) such that the Laplace transform, \( \mathcal{L}f(z) \), of \( f \) can be expressed in terms of the reciprocals of the hypergeometric functions \( pF_q(z) \). In particular we show (in Theorem 4.1) that if \( p > 1 \), \( a_i > 0 \), and \( k_i \) is a positive integer \((i = 1, \ldots, p)\), then there exists a probability density function \( f \) on \( \mathbb{R} \) such that \( f \) is a strict Pólya frequency function of order infinity, and such that \( \mathcal{L}f(z) = 1/p \sum (a_i + k_1, \ldots, a_p + k_p; a_1, \ldots, a_p; z) \). In the case when \( p < q \) we obtain a similar result together with a characterization of the domain on which the probability density \( f \) is a strict Pólya frequency function.

2. PRELIMINARIES

2.1. Totally Positive Kernels [2, 4, 7]

Suppose that \( \mathcal{D} \subseteq \mathbb{R}^2 \) and \( r \) is a positive integer. A kernel \( K: \mathcal{D} \to \mathbb{R} \) is totally positive of order \( r \) (TP,\( r \)) on \( \mathcal{D} \) if for all \( s_1 < s_2 < \cdots < s_r \) and \( t_1 < t_2 < \cdots < t_r \) such that \((s_i, t_j) \in \mathcal{D} \), the \( n \times n \) determinant

\[
\det(K(s_i, t_j)) = \begin{vmatrix}
K(s_1, t_1) & K(s_1, t_2) & \cdots & K(s_1, t_n) \\
K(s_2, t_1) & K(s_2, t_2) & \cdots & K(s_2, t_n) \\
\vdots & \vdots & \ddots & \vdots \\
K(s_n, t_1) & K(s_n, t_2) & \cdots & K(s_n, t_n)
\end{vmatrix} \quad (2.1)
\]

is nonnegative for all \( n = 1, \ldots, r \). If the determinants \( \det(K(s_i, t_j)) \) in (2.1) are strictly positive for all \( n = 1, \ldots, r \), then we say that the kernel \( K \) is strictly totally positive of order \( r \) (STP,\( r \)) on \( \mathcal{D} \). If \( K \) is TP,\( r \) (STP,\( r \)) for all \( r = 1, 2, \ldots \), then we say that \( K \) is TP,\( \infty \) (STP,\( \infty \)) on \( \mathcal{D} \).

A \( C^\infty \) kernel \( K \) is extended totally positive (ETP) on \( \mathcal{D} \) if for all \( n = 1, 2, \ldots \), the \( n \times n \) determinant

\[
\tilde{K}(x, y) = \det \left( \frac{\partial^{i+j-2}}{\partial x^{i-1} \partial y^{j-1}} K(x, y) \right)
\]

is positive for all \((x, y) \in \mathcal{D} \). It is known [7, p. 55] that if \( K \) is STP,\( \infty \) and real-analytic then it is ETP. Conversely, if \( K \) is ETP then it is STP,\( \infty \).
A standard technique for constructing totally positive kernels is the basic composition formula [7, p. 17]: If the kernels $K$ and $L$ are $\mathrm{TP}_k$ and $\mathrm{TP}_l$ respectively, and $d\mu$ is a nonnegative Borel measure on $\mathbb{R}$ such that the integral

$$M(x, y) = \int_{\mathbb{R}} K(x, w) L(w, y) d\mu(w) \quad (2.2)$$

converges absolutely, then the kernel $M$ is $\mathrm{TP}_r$, where $r = \min\{k, l\}$. The proof of this result is by an application of the well-known Binet-Cauchy formula [7, p. 1].

2.2. Zonal Polynomials and Schur Functions

Let $m = (m_1, \ldots, m_n)$ be a partition; that is, the $m_i$ are nonnegative integers such that $m_1 \geq m_2 \geq \cdots \geq m_n$. For each partition $m$ define the Schur function $\chi_m$ on $\mathbb{R}^n$ by

$$\chi_m(t_1, \ldots, t_n) = \frac{\det(t_i^{m_j+n-j})}{V(t)} \quad (2.3)$$

whenever $t_1, \ldots, t_n$ are distinct, and by L'Hospital's rule otherwise. Then $\chi_m$ is a polynomial on $\mathbb{R}^n$, homogeneous of degree $|m| = m_1 + \cdots + m_n$, and is invariant under the symmetric group on $n$ symbols. For each $t \in S_n$ with eigenvalues $t_1, \ldots, t_n$, we define

$$\chi_m(t) = \chi_m(t_1, \ldots, t_n). \quad (2.4)$$

The formula (2.4) extends $\chi_m$ to a unitarily invariant polynomial on the space $S_n$; that is, $\chi_m(utu^{-1}) = \chi_m(t)$, $t \in S_n$, $u \in U(n)$.

For each partition $m$, define the zonal polynomial $Z_m$ on $S_n$ by

$$Z_m(t) = \frac{|m|! \prod_{1 \leq j < k \leq n} (m_j - m_k - j + k)}{\prod_{j=1}^n (m_j + n - j)!} \chi_m(t). \quad (2.5)$$

The normalization (2.5) is chosen so that [3, Equation (5.3.2); 6]

$$(tr t)^j = \sum_{|m| = j} Z_m(t). \quad (2.6)$$
2.3. Hypergeometric Functions of Matrix Argument

For many $a \in \mathbb{C}$, let $(a)_k = a(a+1) \cdots (a+k-1)$, $k = 0, 1, 2, \ldots$, be the usual Pochhammer symbol. Further, for any partition $m$, define the generalized Pochhammer symbol

$$[a]_m = \prod_{j=1}^{n} (a - j + 1)_j, \quad (2.7)$$

The hypergeometric function $\,_{p}F_{q}$ of matrix argument is defined to be the real-analytic function on $S_n$ given by the series expansion

$$\,_{p}F_{q}(a_1, \ldots, a_p; b_1, \ldots, b_q; t) = \sum_{j=0}^{\infty} \frac{1}{j!} \sum_{|m| = j} \left[ \frac{[a_1]_m \cdots [a_p]_m}{[b_1]_m \cdots [b_q]_m} \right] Z_m(t), \quad (2.8)$$

where none of the numbers $-b_i + j - 1$ ($1 \leq i \leq q$, $1 \leq j \leq n$) is a nonnegative integer.

In the case $n = 1$, we denote the classical generalized hypergeometric function by $\,_{p}F_{q}(a_1, \ldots, a_p; b_1, \ldots, b_q; t)$. The connection between the hypergeometric functions $\,_{p}F_{q}$ and their classical counterparts $\,_{p}F_{q}$ is [4, Theorem 4.2; 5] that if the eigenvalues of $t \in S_n$ are $t_1, \ldots, t_n$, respectively, then

$$\,_{p}F_{q}(a_1, \ldots, a_p; b_1, \ldots, b_q; t) = \frac{\det(t^{a-i} \,_{p}F_{q}(a_1 - i + 1, \ldots, a_p - i + 1; b_1 - i + 1, \ldots, b_q - i + 1; t_j))}{V(t)}.$$

$$\quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \ quadratic functions.
3. TOTAL POSITIVITY PROPERTIES OF GENERALIZED HYPERGEOMETRIC SERIES

In [2, Theorems 6, 7] and [4, Theorem 5.3], it was proved that if $a_i > 0$ for $i = 0, 1, \ldots, p$, then the kernels $K(x, y) = F_p^p(a_1, \ldots, a_p; a_1 + 1, \ldots, a_p + 1; xy)$ and $K(x, y) = F_p^p(a_0, a_1, \ldots, a_p; a_1 + 1, \ldots, a_p + 1; xy)$ are STP$_\infty$ on the domains $R^2$ and $\{(x, y) \in R^2: |xy| < 1\}$, respectively. Naturally, this raises the problem of whether similar results hold for the kernels $K(x, y) = F_p^p(a_1, \ldots, a_p; a_1 + 2, \ldots, a_p + 2; xy)$ and $K(x, y) = F_p^p(a_0, a_1, \ldots, a_p; a_1 + 2, \ldots, a_p + 2; xy)$. It follows from Corollary 4.4 in [4] that a necessary and sufficient condition for the kernel $K(x, y) = F_p^p(a_0, a_1, \ldots, a_p; b_1, \ldots, b_q; xy)$ to be STP$_\infty$ on a domain of the form $\{(x, y) \in R^2: \alpha < xy < \beta\}$ is that

$$pF_q(a_1 + n - 1, \ldots, a_p + n - 1; b_1 + n - 1, \ldots, b_q + n - 1; xI_n) > 0 \quad (3.1)$$

for all $n = 1, 2, \ldots$, and for all $\alpha < x < \beta$, where $I_n$ denotes the $n \times n$ identity matrix. In the case when $q = p - 1$ or $p$ and $b_i = a_i + 1$, $i = 1, \ldots, q$, we deduced the inequality (3.1) in [4] from an Euler integral formula (in the case $p = 1$) and induction on $p$. Here, we apply the criterion (3.1) to generalize the results in [2] and [4].

**Theorem 3.1.** Let $a > 0$, $b > 0$, and $k$ be a positive integer. Then the following results hold:

1. the kernel $K(x, y) = F_p^p(a; a + k; xy)$ is STP$_\infty$ on $R^2$.
2. the kernel $K(x, y) = F_q^p(a, b; a + k; xy)$ is STP$_\infty$ on the domain $\{(x, y) \in R^2: |xy| < 1\}$.

**Proof.** To prove (1) we need to show that, for any positive integer $n$, the function

$$\phi_n(x) = F_1(a + n - 1; a + k + n - 1; xI_n) > 0$$

for all $x \in R$.

Suppose that $x \geq 0$. Then for any partition $m$ and $a > 0$, it follows from (2.7) that $[a + n - 1]_m > 0$. Further, $Z_m(xI_n) = x^{[m]}Z_m(I_n) \geq 0$, since $Z_m(I_n) > 0$ [3, Equation (5.3.1)]. Therefore, the positivity of $\phi_n(x)$ follows from the zonal polynomial expansion (2.8) of the function $F_1$.

If $x < 0$, then by the Kummer identity [4, Equation (5.5); 6]

$$F_1(a; c; t) = e^{tr(t)}F_1(c - a; c; -t)$$

we find that
\[ \phi_n(x) = e^{nx} \frac{1}{F_1(k; a + k + n - 1; -x)} . \]

Then the positivity of \( \phi_n(x) \) again follows from the zonal polynomial expansion of the function \( F_1 \).

In proving (2), we similarly need to show that the function
\[ \phi_n(x) = 2F_1(a + n - 1, b + n - 1; a + k + n - 1; xI_n) > 0 \]
for \(|x| < 1\). If \( 0 < x < 1 \), then we use the zonal polynomial expansion of the function \( 2F_1 \) to deduce the positivity of \( \phi_n(x) \). If \( -1 < x < 0 \), then by the Kummer identity [4, Equation (5.8); 6]
\[ 2F_1(a, b; c; t) = \det(I_n - t)^{-b} 2F_1(c - a, b; c; t(I_n - t)^{-1}) , \]
which is valid for \( ||t|| < 1 \) and \( ||t(I_n - t^{-1})|| < 1 \), we obtain
\[ \phi_n(x) = (1 - x)^{-m(b + n - 1)} 2F_1(k, b + n - 1; a + k + n - 1; -x(1 - x)^{-1}I_n) . \]

Hence the positivity of \( \phi_n(x) \) also follows from the zonal polynomial expansion of the function \( 2F_1 \).

To extend Theorem 3.1 to the generalized hypergeometric series \( pF_p \) and \( p+1F_p \), we need to recall [7, Chapter 7] that a function \( f: \mathbb{R} \to \mathbb{R} \) is a Pólya frequency function of order \( r \) (PF\(_r\)) if the kernel \( K(x, y) = f(x - y) \) is TP\(_r\) on \( \mathbb{R}^2 \). Now here is the complete extension of Theorem 3.1; note that the method of proof is the same as in [2, Theorem 6].

**Theorem 3.2.** Let \( a_{j} > 0 \), \( j = 0, 1, \ldots, p \), and \( k_j \) be a positive integer, \( j = 1, \ldots, p \). Then the following results hold:

1. The kernel \( K_p(x, y) = pF_p(a_1, \ldots, a_p; a_1 + k_1, \ldots, a_p + k_p; xy) \) is STP\(_\infty\) on \( \mathbb{R}^2 \).
2. The kernel \( K_{p+1}(x, y) = p+1F_p(a_0, a_1, \ldots, a_p; a_1 + k_1, \ldots, a_p + k_p; xy) \) is STP\(_\infty\) on the domain \( \{(x, y) \in \mathbb{R}^2 : |xy| < 1\} \).

**Proof.** Since the proofs of (1) and (2) are similar, we only provide details for the proof of (1). For \( p = 1 \), we have already proved in Theorem 3.1 that the kernel \( K_1 \) is ETP (and hence STP\(_\infty\)) on \( \mathbb{R}^2 \). By inductive hypothesis,
assume that $K_{p-1}$ is STP on $\mathbb{R}^2$. It is well known that the functions $p_{\mathcal{F}_q}$ satisfy the Euler integral formula

$$
p_{\mathcal{F}_q}(a_1, \ldots, a_p; b_1, \ldots, b_q; x) = \frac{\Gamma(b_q)}{\Gamma(a_p)\Gamma(b_q - a_p)} \times \int_0^1 w^{a_p - 1}(1 - w)^{b_q - a_p - 1} p_{-1}\mathcal{F}_{q-1}(a_1, \ldots, a_{p-1}; b_1, \ldots, b_{q-1}; xw) \, dw,
$$

where $\Re b_q > \Re a_p > 0$, and for all $x$ such that the $p_{\mathcal{F}_q}$ series converges. Therefore, for $x > 0$,

$$
K_p(x, y) = \frac{\Gamma(a_p + k_p)}{\Gamma(a_p)\Gamma(k_p)} \int_0^1 w^{a_p - 1}(1 - w)^{k_p - 1} K_{p-1}(xw, y) \, dw
$$

$$
= \frac{\Gamma(a_p + k_p)}{\Gamma(a_p)\Gamma(k_p)} x^{-(a_p + k_p - 1)} \int_0^x w^{a_p - 1}(x - w)^{k_p - 1} K_{p-1}(w, y) \, dw.
$$

(3.2)

If we define

$$
d\mu(w) = \frac{\Gamma(a_p + k_p)}{\Gamma(a_p)} w^{a_p - 1} \, dw, \quad w > 0,
$$

and

$$
L(x, w) = \begin{cases} 
\frac{x^{-(a_p + k_p - 1)}(x - w)^{k_p - 1}}{\Gamma(k_p)}, & 0 < w < x < \infty, \\
0, & 0 < x \leq w < \infty,
\end{cases}
$$

(3.3)

then (3.2) becomes

$$
K_p(x, y) = \int_0^\infty L(x, w) K_{p-1}(w, y) \, d\mu(w).
$$

(3.4)
By [7, p. 107, Theorem 2.1], the function

\[ f(x) = \frac{x^{k_p-1}}{\Gamma(k_p)}, \quad x > 0, \quad (3.5) \]

is PF, hence the kernel \( L \) is TP on \( \mathbb{R}^2_+ \). Since \( K_{p-1} \) is STP on \( \mathbb{R}^2 \) by the inductive hypothesis, then on applying the basic composition formula (2.2) to (3.4), we deduce that \( K_p \) is STP on \( \mathbb{R}_+ \times \mathbb{R} \). By analyticity, we also find that \( K_p \) is ETP on \( \mathbb{R}_+ \times \mathbb{R} \).

For \( x < 0 \), we rewrite (3.4) as

\[ K_p(x, y) = \int_{-\infty}^{\infty} L(-x, w) K_{p-1}(w, -y) \, d\mu(w). \quad (3.6) \]

Proceeding in a similar manner, we again deduce, by applying the Binet-Cauchy formula to (3.6), that \( K_p \) is ETP on \((-\infty, 0) \times \mathbb{R}\). By continuity, \( K_p \) is ETP (and hence STP) on \( \mathbb{R}^2 \).

**Remark 3.3.** Proceeding in similar fashion, we can also prove that if \( k_1, \ldots, k_p \) are positive but not all integers, then the kernels \( K_p \) in Theorems 3.1 and 3.2 are TP where \( r = \min([k_i] : k_i \text{ is nonintegral}) + 1 \), where \([k]\) denotes the greatest integer less than or equal to \( k \). The proof rests on the property [7, p. 107] that if \( k_p \) is not a positive integer then the function \( f(x) \) in (3.5) is TP \([k_p]+1\).

4. **Pólya Frequency Properties of Generalized Hypergeometric Series**

In [7], PF properties have been derived for some of the generalized hypergeometric series. For instance in [7, Chapter 3], the results include a derivation of the PF properties of the \( _0\mathcal{F}_1 \) hypergeometric series. For other \( _p\mathcal{F}_q \) series, the methods of [7] together with classical Euler integrals can be used to develop the corresponding PF properties. As an example, let us prove that the function

\[ f(x) = x^{a+b-1} \mathcal{F}_1(a; a+b; x), \quad x > 0, \]

is PF, where \( a \) and \( b \) are positive integers.

By (3.2) with \( p = 1 \),

\[ x^{a+b-1} \mathcal{F}_1(a; a+b; x) = \frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)} \int_0^x w^{a-1}(x-w)^{b-1} \, dw, \quad x > 0. \]
Therefore we obtain \( f(x) \) as a convolution,

\[
\frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)} x^{a+b-1} \,_2\F_1(a; a+b; x) = x^{b-1} * x^{a-1}e^x, \quad x \leq 0. \tag{4.1}
\]

Since the class of PF\(_\infty\) functions is closed under convolutions, and both functions on the right hand side of (4.1) are PF\(_\infty\), then it follows that \( f(x) \) is also PF\(_\infty\).

In closing, we derive another type of PF\(_\infty\) property for the generalized hypergeometric series by showing that for \( p \leq q \), the reciprocals of the functions \( p\,\F_q \) can be related to PF\(_\infty\) probability density functions. To do this we will need some results from the theory of entire functions [8] and I. J. Schoenberg's deep characterizations [7, Chapter 7] of the class of PF\(_\infty\) density functions.

**THEOREM 4.1.** Suppose that \( p \leq q \), \( a_i > 0 \), \( i = 1, \ldots, q \), and \( k_1, \ldots, k_p \) are positive integers. Then the following results hold:

1. If \( p = q > 1 \), then for any \( \gamma \geq 0 \) and \( \delta \in \mathbb{R} \), there exists a PF\(_\infty\) probability density function \( f \) on \( \mathbb{R} \) such that

\[
e^{-\gamma x^2 + \delta z} p\,\F_q(a_1 + k_1, \ldots, a_p + k_p; a_1, \ldots, a_p; z) = \frac{1}{\mathcal{L}f(z)}. \tag{4.2}\]

Further, the density function \( f \) is actually strictly PF\(_\infty\) in the sense that the kernel \( K(x, y) = f(x - y) \) is STP\(_\infty\) on \( \mathbb{R}^2 \).

2. If \( p < q \), then for any \( \delta \geq 0 \) there exists a PF\(_\infty\) probability density function \( f \) on \( \mathbb{R}_+ \) such that

\[
e^{\delta z} p\,\F_q(a_1 + k_1, \ldots, a_p + k_p; a_1, \ldots, a_p; z) = \frac{1}{\mathcal{L}f(z)}. \tag{4.3}\]

Further, for any \( n = 1, 2, \ldots \), if \( x_1 < \cdots < x_n \) and \( y_1 < \cdots < y_n \), then the \( n \times n \) determinant \( \det(f(x_i - y_j)) \) is strictly positive if and only if there holds the interlacing condition

\[-\infty < y_i + \delta < x_i, \quad i = 1, \ldots, n. \tag{4.4}\]

**Proof.** If \( p \leq q \), then the hypergeometric function \( p\,\F_q(a_1, \ldots, a_p; b_1, \ldots, b_q; z) \) is an entire function of order \( \rho = (q - p + 1)^{-1} \), which equals
one if \( p = q \). Hence the genus \( g \) of \( pF_p(a_1, \ldots, a_p; b_1, \ldots, b_p; z) \) is zero or one. In the case of the confluent hypergeometric function \( _1F_1 \), it is known [1, p. 184] that \( g = 1 \); using this result together with induction on \( p \) and the confluence relation between \( pF_p \) and \( p+1F_{p+1} \), we deduce that \( g = 1 \) for all the functions \( pF_p \).

By Hadamard's factorization theorem [8, p. 250],

\[
pF_p(a_1 + k_1, \ldots, a_p + k_p; a_1, \ldots, a_p; z) = e^{az + \beta} \prod_{j=1}^{\infty} (1 + \lambda_j z)e^{-\lambda_j z}, \quad (4.5)
\]

where \( \alpha \) and \( \beta \) are constants and \( z_j = -1/\lambda_j \) are the zeros of \( pF_p \). Setting \( z = 0 \) in (4.5), we obtain \( \beta = 0 \). Further, by taking logarithms on both sides of (4.5), differentiating with respect to \( z \), and setting \( z = 0 \), we obtain \( \alpha = (a_1 + k_1) \cdots (a_p + k_p)/(a_1 \cdots a_p) \). Note also that \( \lambda_j > 0 \) for all \( j \). To prove this, we write

\[
pF_p(a_1 + k_1, \ldots, a_p + k_p; a_1, \ldots, a_p; z) = \sum_{j=0}^{\infty} \frac{\psi(j) z^j}{j!},
\]

where

\[
\psi(z) = \prod_{i=1}^{p} \frac{\Gamma(z + a_i + k_i) \Gamma(a_i)}{\Gamma(z + a_i) \Gamma(a_i + k_i)}
\]

is an entire function of genus zero. By a theorem of Laguerre [8, p. 270, §8.63], it follows that \( z_j \) is real and negative; hence \( \lambda_j > 0 \) for all \( j \). Since \( g = 1 \), we also have that \( \sum \lambda_j \) diverges while \( \sum \lambda_j z < \infty \) [in fact, \( \sum \lambda_j z \) can be calculated explicitly by taking logarithms of (4.5), differentiating twice with respect to \( z \), and setting \( z = 0 \)].

Putting all these results together, we have now shown that for any \( \gamma \geq 0 \) and \( \delta \in \mathbb{R} \),

\[
e^{-\gamma z^2 + \delta z} pF_p(a_1 + k_1, \ldots, a_p + k_p; a_1, \ldots, a_p; z)
\]

\[
= e^{-\gamma z^2 + (\alpha + \delta) z} \prod_{j=1}^{\infty} (1 + \lambda_j z)e^{-\lambda_j z}. \quad (4.6)
\]

By [7, p. 345, Theorem 3.2], the right hand side of (4.6) equals \( 1/\mathcal{F}(z) \),
where $f$ is a PF$_{\infty}$ probability density function on $\mathbb{R}$. By [7, p. 357, Theorem 6.1], $f$ is actually strictly PF$_{\infty}$ since $\sum \lambda_j^2 < \infty$.

To prove (2), we proceed in a similar fashion. In this case, $\rho < 1$ and $g = 0$. The corresponding infinite product representation is that for any $\delta > 0$,

$$e^{8\delta} p_j \mathcal{F}_q(a_1 + k_1, \ldots, a_p + k_p; a_1, \ldots, a_q; z) e^{8\delta} \prod_{j=1}^{\infty} (1 + \lambda_j z), \quad (4.7)$$

where $\lambda_j > 0$ and $\sum \lambda_j < \infty$. Since $\rho < 1$, then $\sum \lambda_j < \infty$ [in fact, $\sum \lambda_j = (a_1 + k_1) \cdots (a_p + k_p)/(a_1 \cdots a_q)$]. Again appealing to [7, loc. cit.], we see that the right hand side of (4.7) equals $1/\mathcal{F}(z)$, where $f$ is a PF$_{\infty}$ probability density function on $\mathbb{R}_+$. Finally, the interlacing condition (4.4) for strict positivity follows from [7, p. 358, Equation (6.3)].

I wish to thank the referees for suggestions which helped to improve the exposition of the paper.
